

PS3.2

DECOLONIZING KNOWLEDGE PRODUCTION AND UTILIZATION

| BACKGROUND

Knowledge production was an essential part of the colonial project, setting patterns that remain prominent in global health today. Inequalities in these current processes take many forms with today's global health research, such as in authorship and publishing, the dominance of western methods and practitioners, the silencing of other peoples and traditions, and pathologizing or appropriating indigenous knowledge. This had, and has, many consequences for health and development in LMICs, which has diverged substantially from the processes observed in wealthy countries.

The historical trajectory of these inequalities is easily traced. The most obvious colonial legacy in this respect is "tropical medicine," a field that emerged around 1900 in all major colonizing nations of Europe, and in the US in connection with its imperial ambitions. This academic specialty served business and national interests by studying health obstacles to military and commercial conquest. Tropical medicine was concerned with health threats to metropolitan interests, and later evolved a secondary purpose in serving indigenous or native people in ways that were transactional or extractive. This tradition of tropical medicine evolved as colonial medicine and later international health. The Liverpool School of Tropical Medicine and the London School of Tropical Medicine were the first two such schools and remain prominent today. This legacy is further exemplified by other European institutions, including the Netherlands' KIT Royal Tropical Institute, which was founded in 1910 as the Colonial Institute, or the Institute of Tropical Medicine in Antwerp, founded in 1906 to address the threat of trypanosomiasis in King Leopold II's Congo Free State, or the School of Tropical Medicine in Lisbon, founded along with the Colonial Hospital in 1902 to assist Portugal's colonial ambitions. A parallel story unfolded in the United States, with the emergence of the American Society of Tropical Medicine in 1902 and specialized departments at Tulane, Harvard, and other US medical schools around the same time.

In this way, the institutional roots of global health were established in international agencies and Western academia, both of which were closely tied to national governments, their militaries, and the private sector businesses that led the economic extraction at the core of colonialism. The processes of economic extraction required new knowledge, which the academic specialty emerged to provide. This is why the private sector helped to establish the academic specialty of tropical medicine, e.g., the Elder Dempster shipping company was closely tied to the establishment of the Liverpool School, and the Firestone Rubber Company supported prominent research trips by Harvard faculty to assist in the exploitation of African resources. The Rockefeller Foundation, the result of capital accumulated by Standard Oil, was particularly influential, both by funding leading schools, including Johns Hopkins (1916), Harvard (1922), and the London School of Tropical Medicine (1924), and through its own activities in its International Health Division, established in 1914.

| OBJECTIVES

The objectives of this session include clarifying some of the major definitions and concepts that inform calls to decolonize knowledge production in global health. The session will feature speakers who will draw attention to specific problems and experiences that inform their interest in decolonizing global health.

Speaker

Eirliani Abdul Rahman

Doctoral Student

Harvard University
United States of America

A New America Open Technology Institute Fellow and a P.E.O. International Peace scholar, Eirliani is a final-year doctoral student in public health at Harvard University. She is a member of the inaugural cohort of "Harvard Students in AI" program hosted by the Berkman Klein Center at the Harvard Law School. She was named the recipient of the 2021 American Public Health Association's International Health Section Student Annual Meeting Grant and has also received fellowships and awards from Harvard. She won the inaugural doctoral fellowship from the University of Konstanz's Centre for Human | Data | Society and was named a visiting researcher by the University of Cambridge for February 2024.

Since its inception in 2016, she was a founding member of Twitter's Trust and Safety Council as an expert on child online safety. In December 2022, Eirliani made global headlines following her resignation from the council, speaking out against the meteoric rise in hate speech after Elon Musk's purchase of the platform. In response, Musk dissolved the council four days later. In the week preceding Christmas, Musk removed the #ThereisHelp, a suicide prevention feature on Twitter. She lobbied against this, with the Reuters article reporting it going viral. Faced with public pressure, Twitter reinstated it. Her work has been profiled by inter alia the BBC, CBC, NPR, Slate, Harvard Public Health, the Sunday Times, and Business Insider.

Winner of the 2015 BMW Foundation Responsible Leaders Award, she is a Fellow of the Royal Society for the Arts. She co-founded YAKIN (Youth, Adult survivors & Kin In Need), a nonprofit to help adult survivors of child sexual abuse (CSA). Eirliani edited Nobel Peace Prize laureate Kailash Satyarthi's book *Will for Children* published in 2016. Her book on true accounts by survivors of CSA *Survivors: Breaking the Silence on Child Sexual Abuse*, published in 2017, is now in its third print run. She contributed a case study to the medical textbook *Essentials of Global Health*, which won first prize under the Public Health category in the 2019 British Medical Association book awards. She is a member of Chatham House in London. Her op eds have been published by inter alia Newsweek, Harvard Public Health, Chatham House and the German Council on Foreign Relations.
